

In reference to the subject docket I would like to state that the FCC should require both wireless to wireless phone number portability and wireline to wireless portability. The existing wireless operators are able to track the phone throughout the country and in order to complete a call match an Electronic Serial Number with the Phone Number. It should make no difference what phone number is associated with the particular Electronic Serial Number. In a similar fashion, with the current wireline phone number portability a Phone Number is associated with a particular carrier and central office circuit. I fully believe that the resistance to the proposed portability requirements is an attempt to have the FCC endorse a legal restraint of trade and therefore the FCC should require that the wireless and wireline operators offer universal phone number portability. Thank you.
